MetricsMiddleware

Warning

You need to install dependencies to use The Prometheus Metrics Middleware.

```
$ pip install authx_extra
```

class authx_extra.metrics.MetricsMiddleware

```
MetricsMiddleware(app, prefix='authx_', buckets=(0.002, 0.05, 0.1, INF))
```

Bases: `BaseHTTPMiddleware`

Metrics middleware collecting prometheus metrics for each request.

Initialize a new MetricsMiddleware instance.

Source code in `authx_extra/metrics.py`

```
def __init__(
    self,
    app: FastAPI,
    prefix: str = "authx_",
    buckets: typing.Tuple[float, ...] = (
        0.002,
        0.05,
        0.1,
        prometheus_client.utils.INF,
    ),
) -> None:
    """Initialize a new MetricsMiddleware instance."""
    super().__init__(app)
    self.request_count = request_count(prefix)
    self.request_time = request_time(prefix, buckets)
```

attr request_count `instance-attribute`

```
request_count = request_count(prefix)
```

attr request_time `instance-attribute`

```
request_time = request_time(prefix, buckets)
```

attr app `instance-attribute`

```
app = app
```

attr dispatch_func `instance-attribute`

```
dispatch_func = dispatch if dispatch is None else dispatch
```

meth dispatch async

```
dispatch(request, call_next)
```

Record request method, path and status when dispatching.

Source code in `authx_extra/metrics.py`

```
32 async def dispatch(self, request: Request, call_next: typing.Callable):
33     """Record request method, path and status when dispatching."""
34     method = request.method
35     path = request.url.path
36     status = 500
37     begin = time.time()
38     try:
39         response = await call_next(request)
40         status = response.status_code
41     finally:
42         # track urls w/ params grouped, eg. /items/123 -> /items/{id}
43         router = request.scope.get("router")
44         endpoint = request.scope.get("endpoint")
45         if router and endpoint:
46             for route in router.routes:
47                 route_app = getattr(route, "app", None)
48                 route_endpoint = getattr(route, "endpoint", None)
49                 if endpoint in (route_app, route_endpoint):
50                     path = route.path
51                     break
52         end = time.time()
53         labels = [method, path, status]
54         self.request_count.labels(*labels).inc()
55         self.request_time.labels(*labels).observe(end - begin)
56     return response
```
