FastAPI Reference

Background Tasks - `BackgroundTasks`

You can declare a parameter in a *path operation function* or dependency function with the type `BackgroundTasks`, and then you can use it to schedule the execution of background tasks after the response is sent.

You can import it directly from `fastapi`:

```
from fastapi import BackgroundTasks
```

class fastapi.BackgroundTasks

```
BackgroundTasks(tasks=None)
```

Bases: `BackgroundTasks`

A collection of background tasks that will be called after a response has been sent to the client.

Read more about it in the FastAPI docs for Background Tasks.

Example

```
from fastapi import BackgroundTasks, FastAPI

app = FastAPI()

def write_notification(email: str, message=""):
    with open("log.txt", mode="w") as email_file:
        content = f"notification for {email}: {message}"
        email_file.write(content)

@app.post("/send-notification/{email}")
async def send_notification(email: str, background_tasks: BackgroundTasks):
    background_tasks.add_task(write_notification, email, message="some notification")
    return {"message": "Notification sent in the background"}
```

Source code in `starlette/background.py`

```
def __init__(self, tasks: Sequence[BackgroundTask] | None = None):
    self.tasks = list(tasks) if tasks else []
```

attr func `instance-attribute`

```
func = func
```

attr args `instance-attribute`

```
args = args
```

Ask AI

attr kwargs `instance-attribute`

```
kwargs = kwargs
```

attr is_async `instance-attribute`

```
is_async = is_async_callable(func)
```

attr tasks `instance-attribute`

```
tasks = list(tasks) if tasks else []
```

meth add_task

```
add_task(func, *args, **kwargs)
```

Add a function to be called in the background after the response is sent.

Read more about it in the FastAPI docs for Background Tasks.

PARAMETER	DESCRIPTION
`func`	The function to call after the response is sent. It can be a regular `def` function or an `async def` function. **TYPE:** `Callable[P, Any]`

Source code in `fastapi/background.py`

```
def add_task(
    self,
    func: Annotated[
        Callable[P, Any],
        Doc(
            """
            The function to call after the response is sent.

            It can be a regular `def` function or an `async def` function.
            """
        ),
    ],
    *args: P.args,
    **kwargs: P.kwargs,
) -> None:
    """
    Add a function to be called in the background after the response is sent.

    Read more about it in the
    [FastAPI docs for Background Tasks](https://fastapi.tiangolo.com/tutorial/background-tasks/).
    """
    return super().add_task(func, *args, **kwargs)
```
